I want to use a few different sparse arrays and have a matrix that represents these sparse arrays. For example, the matrix below would represent a sparse array where the zeros were changed to ones in the positions marked with an asterisk. 0 0 0 0 0 1 1 0 1 0 1 1 0 0 0 However, I am running into trouble trying to represent matrices of any size. Below is what I have tried. I am using double square brackets to represent a matrix. typedef struct { size_t row; size_t col; unsigned int data; } sparse_array; void make_matrix(sparse_array *s, int a, int b) { int i, j, k; size_t a_size, b_size; a_size=a; b_size=b; s->row=(a*b); edd6d56e20
