The Keystone Macro control surface is the heart of Keystone, an open standard, network based data protection and storage management platform. Keystone achieves secure, easy to use storage for individual users and provides central storage management for an entire organization. With Keystone, users can share data and connect to remote, offsite storage over the Internet. Any computer can access the Keystone platform and share data with other users. By using encryption, it is possible to protect files and directories of sensitive information. Fully configurable, Keystone is easily managed by multiple users.

Keystone supports one-time or annual licensing, and ensures data integrity through encryption and user authentication. A computing device (e.g., a smartphone, a tablet computer, a laptop computer, etc.) may include a display screen for viewing

content such as text, images, video, and/or audio. When displaying such content on the display screen, the computing device may provide a user interface for modifying the display (e.g., moving, scaling, rotating, zooming, etc.) of the content. The user interface may include one or more user controls such as a user touch screen, a user selection mechanism, a user gesture (e.g., an input by a user by dragging the finger), etc. The user interface may be implemented in a graphical user interface (GUI) using any of a variety of graphical user interface (GUI) techniques. For example, the user interface may be implemented in a touchscreen GUI in which a computer display (i.e., a screen) is divided into a plurality of regions. In some embodiments, these regions may be further divided into smaller regions (e.g., a quadrant of the screen). A user may touch a region of the display screen and the computing device may detect the position of the touch on the display screen and display a pointer or cursor in the touched region. As the user drags the finger (e.g., the user's touch screen finger) on the touchscreen display, the computing device may translate the cursor to the region touched by the user's finger. A user may drag the finger from one region to another region to perform an action such as changing the cursor location.
