I'm getting really angry that this kind of thing is happening. Even after Microsoft create an incredible amount of resources to deal with this kind of problem, still doesn't seem to be working properly. I've been using the command line while the software was being updated this morning because it seemed to work ok, but this morning the updates resulted in the problem that I've described above. I've re-downloaded the software I wanted to use to re-install it, but no luck... the problem still appears. All the software that I used to install this software is outdated. I got versions of Windows prior to Vista, such as XP and 2000. I know that in this case it's the "Determine" part of the update that is causing the problem, because if I update a single program and press "Determine" then I get a message "The installer cannot be opened. Windows cannot find 'C:\install.msi' (Error loading the installer file.)" I've tried updating all the programs again, but still I'm getting the same problem. I don't understand why should Windows not find the msi file, it's there. Furthermore, I made an extensive research and this is the only msi file that causes this kind of issue. The msi file that I'm talking about is located at: C:\Program Files\Microsoft Visual Studio 11.0\Common7\IDE\VSNET.DLL_VSNET_9.0.9013.0\VSNET.DLL.DEFAULT.mui. If I go to the location of the msi file it clearly shows the file But Windows cannot find the msi file at all. What am I missing? A: What am I missing? The file is located in C:\Program Files\Microsoft Visual Studio 11.0\Common7\IDE\VSNET.DLL_VSNET_9.0.9013.0\VSNET.DLL.DEFAULT.mui. Windows 7 has no idea about the IDE parts of the Visual Studio installer, which are: â¢ the Visual Studio IDE â¢ the Visual Studio IDE Service â¢ the Visual Studio "IDE for Mac" â¢ the "Visual Studio Console Host" service â¢ the "Visual Studio Command Prompt"
